## **ACKNOWLEDGEMENT**

Firstly, I would like to record my deepest appreciation to my project supervisor, Pn. Bibi Norasiqin Bt. Sheikh Rahimullah for the consistent consultation and invaluable advice throughout the preparation and completion of this project. Also, I would like to thank all the laboratory personnel for their involvement and assistance in making this project successful.

Secondly, I would like to express my sincere gratitude and heartfelt to my beloved parent, En. Abdullah B. Ismail and Pn. Radziah Bt. Mahmud for their guidance and love in nurturing me to be who I am today. Also, to my brothers and sisters through their caring, motivations and understanding, they have taught me to have the courage to believe in myself even more.

Last but not least, I would like to thank all my friends who had given their ideals, support and encouragement throughout the study. THANK YOU.

## **ABSTRACT**

This paper describes the design of a dc-to-dc (chopper) converter for resonant condition. This resonant converter is designed to be used in high frequency application. The parallel arrangement of resistor, inductor and capacitor is used in the design to develop the resonant frequency. Simulation results show that the proposed design gives better efficient operation at higher switching rates.
