ACKNOWLEDGEMENT

First and foremost, I am grateful to Allah S.W.T for the blessing, strength and the guidance given during completing this final year project with the title A Comparative Study of Performance Carrier Frequency Offset estimation method towards QAM-MIMO-OFDM systems. Peace and blessing to Prophet Muhammad s.a.w who has brought the light to all mankind.

I would like to give my deepest appreciation to my beloved project supervisor, Madam Suzi Seroja Sarnin for her continued guidance, advice, patience with my attitudes, knowledge and moral support all this while until I manage to complete this project successfully.

Not forgotten to my lovely family, to my parents nothing can be compared to the strong support and love that they gave throughout this research. They always are there when needed. Support all my financial and always give a motivation.

Finally, I would like to thank my friends who can be helping me a lot. I am grateful for the sharing of knowledge and information among my friends.

ABSTRACT

As we know the communication system evolving and enhancing, the need for high speed and reliable communication system is crucial. With the communication of multiple-input multiple-output (MIMO) communication system along orthogonal frequency division multiplexing (OFDM), a reliable high rate communication system can be achieved. Carrier Frequency Offset (CFO) is the problem of multiple-input multiple-output along orthogonal frequency division multiplexing (MIMO-OFDM). The MIMO-OFDM system with 2x2, 3x3, and 4x4 antenna configurations will use 256, 512, and 1024 QAM modulation level in the presence of multipath Rayleigh and Additive White Gaussian Noise (AWGN) channel. The performance evaluation of the system is determined in Bit Error Rate (BER) versus Energy per Bit to Noise Power Spectral Density Ratio (E_b/N_0). The CFO can estimate by using two methods which are the techniques in the Frequency Domain and Time Domain. Both of techniques divide by two, each of the Frequency domain is a Training Symbol (Moose) method and Pilot Tones (Classen) method. And for the time domain is a Cyclix Prefix (CP) method. The MIMO-OFDM system with Carrier Frequency Offset Estimation method will be designed and simulated using MATLAB where the results will then be analyzed. From the results obtained, it can be said that as the QAM level increased the BER will increase too. Besides that, the performance of the system will improve as the amount of transmit and receive antennas increase. In addition, the great performance showed by the MIMO-OFDM system is greatly enhanced by the estimation technique used which is the carrier frequency offset estimation. Carrier Frequency Offset accurately recovered the distorted error signal through the multipath fading channel, thus improve the performance of the MIMO-OFDM system.
