ACKNOWLEDGEMENT

First of all, all praise to Allah S.W.T for giving me a strength and patience in completing my final year thesis project.

Deepest appreciation and sincere gratitude to my advisor Miss Anastasia Harbi for all the patience, guidance, commitment, time spent, ideas and also encouragement from time to time in helping me to complete this study. I need a lot of guidance to complete this thesis as I faced some difficulties in handling my report and all the tests that were used in this study.

I also would like to thank to Assoc. Prof Dr. Imbarine Bujang for the knowledge that he has taught during MGT646 (Quantitative Research Methods) class. This subject helps me a lot in completing this study. With all the knowledge given, it makes me more interested to learn more in research area.

Greatest appreciation to my family who always give me continuous moral and financially support throughout the period of my study. I would like to dedicate this study for them with hope that they will be proud and happy with the final result.

Lastly, I would like to thank to my course mate who always help me if I was facing any problem in this study especially during conducting the test and also in the data analysis. They will always help me to answer my questions no matter at any time. We always share our knowledge and ideas about this study until our thesis completed.

ABSTRACT

Housing market had been developed from year to year in Malaysia. Hence, the demand for a living place has increased due to a better standard of living. In this case, it caused the price of housing property keep rising until the affordability limit, thus, it will lead to an existence of housing bubble. Therefore, in this study, it will determine the relationships of economic determinant factors towards Malaysian housing price and also investigate the existence of the bubble within the period of 12 years which is from 2004-2015. The economic determinant factors that included in this study are inflation rate (INFR), income (GDP), and interest rate. Otherwise, the findings from Right Tailed Augmented Dickey Fuller Test in this study mentioned that there is an existence of housing bubble. Moreover, GDP have a positive strongly significant with HPI. It means that any changes in GDP will also affect the changes in HPI.
