

EXPERIMENTAL AND THEORETICAL INVESTIGATION OF
A THREE-WAY DOUBLE-LAYER SPACE
GRID SYSTEM TRUSS

by

MOHD SUHAIMI RAFIE

(ADVANCED DIPLOMA IN CIVIL ENGINEERING)

SESSION 79 - 80

under the supervision of

ENCIK WAN MAHMOOD WAN ABDUL MAJID

submitted in the partial fulfillment of
the requirements for the award of
Advanced Diploma in Civil Engineering

SYNOPSIS

This project report contains the theoretical and the experimental investigation of a three-way double-layer space grid system truss.

In the theoretical analysis, computer programs were developed to solve the theoretical model. The programs were based on

- a. Stiffness Method
- b. Plate Analogy with regard to Prof. D.T.Wright's paper.

Both programs were developed on the assumption that the joint has a pin effect. The program developed in Method (a) offers the solution for any pin-jointed structure. In Method (b) the program was developed for a double-layer space truss.

In the experimental investigation a model of a three-way double-layer space grid system was set up. The measurements of forces in selected members and the vertical displacements at selected joints were carried out by the use of strain gauges and dial gauges respectively. A wheatstone bridge circuit was used in the measurement of member forces.

A comparison was made on the results obtained to the result obtained from the 1900 series SPACEFRAME package program which is available at the ITM Computer Center.

ACKNOWLEDGEMENT

The author wishes to express his sincere gratitude to his supervisor En. Wan Mahmood Wan A. Majid for his kind advices, valuable guidance and encouragement throughout the course of this study. He also would like to express his special gratitude to Mr. J.E.Gray, Senior Lecturer, who have given useful advice in the experimental investigation part of the work.

The author would also like to extend his sincere thanks to :

En. Mohd Som Hj Marwi, Senior Civil Lab. Technician, who has helped the author in setting up the model

En. Latif, Senior Electronic Lab. Technician, who has help the author in setting up the read out instruments, and

En. Azlan (Programmer at the ITM Computer Center) and the Computer Operators who have given full co-operation to the author in running his computer program.

The author would like to acknowledge the Electronic Department of the School of Engineering of the Institute for the lending of the read out instrument.

Last not least to those involved directly and indirectly to make this project progress.

LIST OF CONTENTS

SYNOPSIS		1
ACKNOWLEDGEMENT		11
CHAPTER		PAGE
1.0	INTRODUCTION	1
1.1	PURPOSE AND SCOPE	3
2.0	REVIEW OF THE DEVELOPMENT OF SPACE STRUCTURES	4
2.1	DIFFERENT TYPES OF SPACE STRUCTURES	4
2.1.1	Domes	4
2.1.2	Braced Barrel Vaults	20
2.1.3	Grid Frameworks	21
2.1.4	Suspended Roof Structures	31
2.2	METHODS OF ANALYSIS	34
2.3	STABILITY CONSIDERATION	35
2.4	CONSTRUCTION TECHNIQUES AND CONNECTIONS FOR VARIOUS TYPE OF SPACE STRUCTURES	36
2.5	DESIGN DEVELOPMENTS	36
3.0	PLATE ANALOGY	42
3.1	INTRODUCTION	42
3.2	GENERAL DIFFERENTIAL EQUATIONS OF A HOMOGENEOUS PLATE UNDER LATERAL LOADINGS	44
3.2.1	Basic Assumptions	44
3.2.2	Co-ordinates System and Sign Conventions	46
3.2.3	Strain-Stress Relationship	46
3.2.4	Strain-Displacement Relationship	49
3.2.5	Equations of Equilibrium	51
3.2.6	Stress-Displacement Relationship	52
3.2.7	Loading	55
3.3	APPLICATION OF PLATE THEORY TO PROFESSOR D.T.WRIGHT'S PAPER	57
3.3.1	Space Frame System	57
3.3.2	Stress Resultant Transforms	57
3.3.3	Continuum Properties	62

I N T R O D U C T I O N

Most structures in common use consist of elements such as beams, girders and portal frames which are basically two-dimensional from the point of view of analysis as well as design. Interconnecting members in the third dimension are nearly always of a secondary character, present merely for purpose of transferring load and not sharing in the main supporting function of the structure. The fundamental advantage and economy of a form of a structural assembly in which there is integrated load - sharing is obvious, since every part of the structure makes an effective contribution. No single member is necessarily a principal one and a failure or defect in an individual element is not a matter of special consequence.

Space structure in which the three - dimensional function is realised are thus of considerable potential importance, and they are being used in the work of building and structural engineering to an increasing extent. Space structures essentially involve and design in three rather than two dimensions. Thus, a space structure can be defined as ' a three - dimensional assembly of elements, resisting loads which can be applied at any point, inclined at any angle to the surface of the structure and acting in any direction'.

The term is used to describe a wide range of interconnected structural assemblies and structural forms, such as braced domes, braced barrel vaults and single and double - layer grids. It includes folded - plate and stressed - skin systems generally, but excludes shell - types of construction which - because of their popularity in concrete and specialised design form a separate field.

Large intermediate column free area could be obtained by the construction of space structures. There are various domes which already cover wide span up to 200 m (600 ft)
