ACKNOWLEDGEMENT

We would like to take this opportunity to express our appreciation to those who have contributed directly and indirectly towards the completion of this project.

First we would like to thank the Management of UiTM Cawangan Perlis for giving us the permission to use its facilities whenever the need arises.

We also would like to thank Miss Shaharani Abdul Rahman for her dedication as our Research Assistant. Without her many data cannot be acquired in time.

Gratitude is also extended to our colleagues from Department of Computer Science for their willingness to help us to solve our problem.

Last but not least, our warmest appreciation to our families for their understanding and support during the long sleepless night that we have to endure in order to complete this project.

ABSTRACT

Internet services do boost up the culture of 'online' in every aspect of live. However there is limit of time for the user to wait for a web page to be downloaded. Image is known as one of the contribution to longer download time since the file size is bigger. A technique of slicing an image is use to overcome the problem. Experiments are performed to identify the real impact of slicing on downloading time. The finding shows that image slicing can reduce image size in certain situation. However, image slicing will not significantly reduce the download time, yet it still does play some important role in overall image display mechanism.
