PROPERTIES OF PARTICLE BOARD FROM BATAI AND PETAI BELALANG

WAN NUR SHEILA ANIS BT WAN RAFAI

Final Year Report Submitted in
Partial Fulfillment of the Requirements for the
Degree of Bachelor of Science (Hons.) Furniture Technology
in the Faculty of Applied Sciences
Universiti Teknologi MARA

JANUARY 2014

ACKNOWLEDGEMENTS

Alhamdulillah.

Praise to God for His Blessings and Guidance for me that I was able to complete my final year project: Properties of Particle Board from Batai (*Albezia falcataria*) and Petai Belalang (*Leucaena leucocephala*).

I would like to give my special thanks to my advisor, Prof Madya Dr Wan Mohd Nazri bin Wan Abd. Rahman for all the useful comments in guiding me to complete this project. It would not be possible for me to complete this project without their guidance.

I would also like to give my thanks to Prof. Dr. Jamaludin bin Kassim as the Head of Centre, Wood Industry Department for their help to coordinate my final year project for this semester. My gratitude also goes out to Mr. Rudaini and Mr. Shahril a Wood Department staff, for his guidance in handling all equipment during the project session. Thank you also to all staff who was involved directly and indirectly involved in fulfilling my final year project.

Lastly, my thanks also extend to my parents, Wan Rafai bin Wan Konok and Latipah binti Omar, and my family for their support in finishing my studies. I would not be here without their support to complete my studies. Last but not least, thank you to all my friends who supported me to finish this final project. I am very grateful for all the support I have received.

I hope this project will provide knowledge and benefit to the readers. Thank you, Alhamdulillah.

Wan Nur Sheila Anis Bt Wan Rafai

PROPERTIES OF PARTICLE BOARD FROM BATAI (Albezia falcataria) AND PETAI BELALANG (Leucaena leucocephala)

ABSTRACT

This study focus on alternative species to produce particleboard with the targeted density of 600kg/m^3 . Batai (*Albezia falcataria*) was mixed with Petai Belalang (*Leucaena leucocephala*). The main objectives of this study is to determine the particleboard made from admixture of Batai and Petai Belalang. The study was also done to evaluate the effect of particle ratio, resin content and tree's age on the particleboard properties. The particle ratio between species is 100A, 30L: 70A and 50A:50A. The tree's age of Batai using is 1.5 year and 5 year, while the percentage of resin content is 8%, 10% and 12%. The particle ratio between species is 100A, 30L: 70A and 50A:50A. The modulus of rupture, modulus of elasticity, internal bonding and thickness swelling of particleboard were determined according to British Standard Institution (IBS EN Standard). As conclusion, all the samples were fail to achieve the standard. This study had proven that mixture of species Batai and Petai Belalang is not suitable for particleboard manufacturing.
