ABSTRACT

The study of shrinking surface with boundary layer theory has become important in recent years due to development in the industrial application. Magnetohydrodynamic boundary layer flow past over a shrinking sheet with heat transfer. The similarity transformation variables are used for transforming the partial differential equations to ordinary differential equation. The Maple software is used for shooting technique with Runge-Kutta-Fehlberg method to obtain the numerical solution. The effect of parameter which are Prandtl number and the magnetic field on the heat transfer characteristics are presented graphically and discussed in detail. At the surface, it is found that the increasing heat transfer rate increases the Prandtl number but decreases the magnetic parameter.

ACKNOWLEDGEMENT

First, I am very grateful to Allah SWT. With His grace and goodness, I was able to complete the Final Year Project.

Thank you to my supervisor, Madam Zanariah Binti Mohd Yusof for giving me so much attention, good advice, thoughtful ideas, and guiding me from the start until I can complete this project. I was able to learn new things that were quite challenging with the guidance and support from my supervisor. I was able to complete this project and understand the boundary layer problem which is important research in industrial development. I also appreciate and thank Dr. Nurhaslinda binti Zull Pakkal for her extensive guidance and assistance throughout the completion of the Year End Project.

Lastly, my deepest gratitude to my family who prayed for me and supported me in completing this project. Not forget my friend who helped and shared ideas and information.
