

**CONTROLLING 3-PHASE INDUCTION MOTOR USING SINUSOIDAL
PULSE WIDTH MODULATION METHOD.**

Thesis is presented in partial fulfillment for the award of the

Bachelor of Electrical Engineering (Hons)

UNIVERSITI TEKNOLOGI MARA

**MOHD ZAID BIN ZAKARIA
FACULTY OF ELECTRICAL ENGINEERING
UNIVERSITI TEKNOLOGI MARA (UiTM)
SHAH ALAM
MAY 2009**

**FACULTY OF ELECTRICAL ENGINEERING
UNIVERSITI TEKNOLOGI MARA**

ACKNOWLEDGEMENTS

BISMILLAHIRRAHMANIRRAHIM. First of all, I really would like to thank and syukur to Allah S.W.T for His permission and blessing to make this project success. Without His permission, it is impossible to make anything happen and be come true.

I would like to take this opportunity to sincerely express my highest appreciation to my project supervisor Assoc. Prof. Hj Ishak Bin Ismail for all his valuable guidance, teachings, suggestion advices, and support throughout this project. Thank very much for his kindly and help to make this project smoothly in progress and successfully meet the objective.

My deepest appreciation also goes to my beloved parent, and family members for their moral and spiritual support. Not forget to all my friends, who had together with me shared my highs and lows, for all the opinions and suggestions. Finally, for all those who have contributed information, knowledge, ideas, time and effort directly or indirectly in the progress of this final year project. Honestly, I am very grateful for all their favors and support and I will remember in all of my life. Thank you so much again and may ALLAH S.W.T bless them. Thank you.

ABSTRACT

This thesis presents a simple constant volt per hertz control, sinusoidal pulse width modulation output voltage for a three-phase induction motor drive. Essentially an open loop speed control scheme was adopted. The constant V/f speed control involves simultaneous adjustment of voltage and supply frequency in order to achieve variable speed with constant torque. The constant volt per hertz (V/f) method is an effective method for AC motor drive speed regulation. The PIC16F877A microcontroller from microchip was used to generate the SPWM signal to implement the control scheme. Also simple techniques for generating the modulation waves of SPWM methods are described.

TABLE OF CONTENT

CHAPTER 1

INTRODUCTION

1.1	Overview	1
1.2	Literature review	2
1.3	Objectives	3
1.4	Scope of work	3

CHAPTER 2

THEORITICAL BACKGROUND

2.1	Sinusoidal Pulse width Modulation	4
2.2	Insulated Gate Bipolar Transistor (IGBT)	7
2.3	Three phase inverter	7
2.4	Induction Motor Operating Principle	9
2.5	Constant Volt Per Hertz Speed Control	10
2.6	IGBT Driver	11
2.7	Snubber Circuit	12
2.8	Microcontroller PIC16F877A	13

CHAPTER 3

SIMULATION

3.1	Matlab/Power System Blockset/Simulink	16
3.2	Circuit Simulation	18
3.3	Simulation Result	20

CHAPTER 4

SYSTEM OPERATION

		22
4.1	Microcontroller	23
4.2	Three phase inverter	23
4.3	Single Chip IGBT Driver (model IR2130)	23
4.4	Variable speed	23

CHAPTER 1

INTRODUCTION

1.1 Overview

AC induction motors are the most common motors used in industrial motion control systems, as well as in main powered home appliances. Simple and rugged design, low-cost, low maintenance and direct connection to an AC power source are the main advantages of AC induction motors. Various types of AC induction motors are available in the market. Different motors are suitable for different applications. Although AC induction motors are easier to design than DC motors, the speed and the torque control in various types of AC induction motors require a greater understanding of the design and the characteristics of these motors. [1] Nowadays, industry places high demand on control accuracies, flexibility, ease of operation, and repeatability of parameters for many applications such as in induction motor drives are the main desirable features. To meet these requirements, use of microcontrollers has become imperative [3]. The advantage of microcontroller-based control over the conventional discrete hardware-based control can be easily recognized for complex drives control system. The software control algorithm can be easily altered or improved without changing the hardware. Induction motors are the most widely used motors for appliances, industrial control, and automation; hence, they are often called the workhorse of the motion industry. They are robust, reliable, and durable. When power is supplied to an induction motor at the recommended specifications, it runs at its rated speed. However, many applications need variable speed operations. For example, a washing machine may use different speeds for each wash cycle. Historically, mechanical gear systems were used to obtain variable speed. Recently, electronic power and control systems have matured to allow these components to be used for motor control in place of mechanical gears. These electronics not only control the motor's speed, but can improve the motor's dynamic and steady state characteristics. In addition, electronics can reduce the system's average power consumption and noise generation of the motor. [5]
