

**WAVELET ANALYSIS: MULTIPATH MITIGATION FROM GPS  
CARRIER PHASE OBSERVATION**

**This thesis is presented in partial fulfillment for the award of the Bachelor of Electrical  
Engineering (Hons.) Universiti Teknologi MARA.**

**MOHD RIJAL BIN SHUKRI**

**Faculty of Electrical Engineering**

**UNIVERSITI TEKNOLOGI MARA**

**40450 SHAH ALAM, SELANGOR**

## ACKNOWLEDGEMENTS

بِسْمِ اللَّهِ الرَّحْمَنِ الرَّحِيمِ

In the Name of Allah, the Most Beneficent, the Most Merciful. All praise to Allah for the entire incredible gift endowed upon me and for giving the health and strength to keep up the study and enable me to prepare and complete this thesis.

I would like to acknowledge the people who made this project possible my supervisors, Mr. Mohamad Huzaimy Jusoh and Mrs. Norsuzila Ya'acob and also Dr. Ngah Ramzi Hamzah for their kindness, support, and concern in providing valuable ideas, suggestions and guidance's throughout the course. Their input has afforded immeasurable help during my study.

I am also indebted to the various help and discussion offered by my fellow friends to overcome the obstacles that arise during the implementation process. Thank you and may Allah bless and reward them for their generosity.

Last but not least, a special thank to my family for their prayer and support.

My sincere thank to all of you.

## **ABSTRACT**

Multipath mitigation techniques using wavelet decomposition is proposed for extracting or modeling multipath from Global Positioning System (GPS) carrier phase observations. Multipath is a phenomenon whereby satellite signals can arrive at the receiver via multiple paths, due to reflections from nearby objects such as trees, buildings, the ground, water surfaces, vehicles, etc. It can be reduced by choosing sites without multipath reflectors or by using choke-ring antennas to mitigate the reflected signal. Wavelet transform (WT) is a new tool for signal analysis that can provide simultaneously, time and frequency information of a signal sequence. The wavelet is of interest for the analysis of non-stationary signal such as GPS observations because it provides an alternative to classical Fourier Transform, which assumes stationary in signals. Double Differencing (DD) technique was used to detect the multipath effect.
