## ABSTRACT

Non-steroidal Anti Inflammatory Drugs (NSAIDs) are among the most frequently prescribed medications worldwide especially in the developed countries. NSAIDs are a common cause of reported adverse drug side-effects and their safety profiles always become a concern. Despite its therapeutic effects, NSAIDs is associated with side effects involving the upper gastro-intestinal tract (GIT), cardiovascular system and renal function. This is a retrospective drug utilization study of NSAIDs available at Klang Health District primary healthcare government clinics. Patient's data who were NSAIDs user were extracted from electronic system namely e-CMS system. The Defined Daily Dose (DDD) and anatomical therapeutic chemical (ATC) were used in the analysis and comparison of data. The objective of the study is to describe the utilization pattern of non-steroidal anti-inflammatory drugs (NSAIDs) at Klang Health District primary healthcare clinics. The specific objectives for this study are to assess the pattern of NSAIDs prescribed, to estimate Define Daily Dose (DDD) for each NSAIDs prescribed, to determine relation in pattern of NSAIDs usage with patient's characteristics and to identify potential NSAIDs prescription related problem. A total of 852 records were retrieved from 3 respective clinics namely Klinik Kesihatan Anika, Bukit Kuda and Pandamaran with the mean age of 45.5 years old (SD 1.63). Based on their DDD's, the most prescribed NSAIDs were Diclofenac (1.5725), Mefenamic Acid (1.4108), Ibuprofen (0.0166) and Meloxicam (0.0016). Majority of patients received NSAIDs for 5 to 7 days; only for acute cases. Regardless of the age category, gender and race, the main reason of prescribing NSAIDs were because of pain involving musculoskeletal system, pain involving infection at multiple sites and pain involving nervous system. There is no significant association between age category and status of patients who followed WHO defined daily dosage of ( $p=0.522$ ) for Diclofenac. There is also no significant association between gender and races and status of patients who followed WHO defined daily dose ( $p=0.295$ ,  $p=0.714$ ) respectively. Among the NSAIDs user, around 3.2% to 17.6% (according to clinics) had chronic conditions such as hypertension, diabetes mellitus and cardiovascular disease. The prevalence of concurrent antihypertensive usage among all NSAIDs user were 1.8% to 22.9% according to clinics. Mean prevalence of potential drug-drug interaction with NSAIDs in Klang Health District clinics is 8.6%. All potential drug-drug interactions with NSAIDs were involving diuretics and ACE Inhibitors. This study is able to show NSAIDs drug utilization habit among patients especially who were at risk for NSAIDs adverse event or who have chronic conditions that should be monitored closely for adverse event. It was also notable that there is potential drug-drug interactions of NSAIDs prescribed in this study. These results should raise awareness to prescribers and pharmacists of such risk and work collaboratively to encourage safe prescribing and use of NSAIDs.

## ACKNOWLEDGEMENT

First of all, my highest gratitude goes to Allah SWT the Almighty for bestowing me with great strength, patience, and courage in completing this thesis. I am extremely grateful to the Bahagian Perkhidmatan Farmasi, Jabatan Kesihatan Negeri Selangor, Bahagian Pengurusan Latihan, Kementerian Kesihatan Malaysia and Universiti Teknologi Mara (UiTM) for providing me the opportunity to further my studies in Pharmacy Practice.

My sincere and deepest gratitude goes to my supervisor Prof. Dr. Mohamed Mansor B. Manan, for his openness, accessibility, inspirational supervision, constructive suggestions, guidance and advice throughout the study. It has enabled me to develop a better understanding of the subject. My acknowledgment also goes to all lecturers of Faculty of Pharmacy UiTM Puncak Alam for their thoughts, knowledge and contributions during the course.

My sincere appreciation goes to Bahagian Pembangunan dan Kesihatan Keluarga especially Tele Primary Care team and Pejabat Kesihatan Daerah Klang staff especially Mdm. Norharlina Sulaiman for their great data input for my dissertation.

My heartfelt appreciation also goes to all my fellow course mates of Master in Pharmacy Practice 2013-2015 session during the whole process of achieving our Master's degree, particularly those in my group; Azlina, Umi, Shafinaz, Suryawaty, Mas Eliana and Sheeda. Their help, dedication, commitment, advice and presence have made the learning process a much more meaningful and exciting experience. The beautiful moments and memories of the time spent together will always be cherished and remembered for the rest of my life. I really appreciate the friendship we have built and hoped it will last.

I dedicate this work to my family. There is no word to express my gratitude for the support that my husband, Nazrin Izwan B. Mohd Noh has given to me. I could not complete this program without his endless love, patience, understanding and encouragement. To my daughters, Naurah Rania and Nur Hannah Nadhirah, I would like to express my thanks for being such good girls and always cheering me up; thank you for always being by my side. My heartfelt appreciation also goes to all my family members for their love and support throughout my life especially to my mother

, my father Khairudin B. Mohd. Jali, my mother in law and my late father in law – Mohd Noh Bin Munawar. And finally, special and profound thanks to my brother and sisters who offered invaluable support and humor throughout my life. I pray to the Al-Mighty to grant every individual who has contributed to this research, bountiful of His everlasting guidance and appreciation.
