ACKNOWLEDGEMENT

In the name of Allah, the Beneficent, the Merciful, the Almighty One. It is with the deepest sense of gratitude to the God who gives me the strength and ability to complete this project.

I would like to express my personal gratitude to everybody who was involved in this project especially to my supervisor, Pn. Kamariah Ismail who give me a lot of ideas.

My gratitude also goes to my family especially my parents En _____, Pn _____, brothers and sisters Zamzuri Hussein, Bazlin, Wizana, Zuhairi, Aisyah and Rabiatal Adawiyah. Thanks a lot of assistance to complete this final project successfully. To my friends especially Aswan Norhairis Che Omar, Shahrul Azli Md Shah, Hamidi Ahmad, Norhisham Md Yusof, Yusparizal Md Yusof, thanks a lot for the support and understanding.

ABSTRACT

This thesis focuses on the design and development of a wireless laser communication system. Helium Neon class II laser was used to show that the free space laser beam can be used as a medium to transmit voice signal.

The design, construction and test results obtained from each part of the system are adequately described. An overview of laser is also included. Suggestion on ways to improve the system for the actual implementation of a laser communication system are given at the end at the thesis.

TABLE OF CONTENTS

CHAPTER	DESCRIPTION	PAGE
1	INTRODUCTION	
1.1	Introduction	1
1.2	Scope of Thesis	1
1.3	Organisation of the Thesis	2
1.4	Introduction to Laser	3
1.5	The Elements of a Communication System	3
1.6	Some View of Wireless Laser Communication	5
1.7	The Development of Wireless Laser communication System	5
1.8	He-Ne as a Low Power Laser	6
1.9	Differences Between Low Power Laser and Other Light Sources	7
1.10	Limitation of the Laser Use	8
2	FUNDAMENTAL OF LASER BEAM	
2.1	Introduction	9
2.2	Generation of Laser Radiation	9
2.3	Laser Beam Reflection and Refraction	12
2.4	Collimation of a Laser Beam	15
2.5	Laser Beam Splitting	16
2.6	Spontaneous Emission	18
2.7	Light Emitted By Laser Beam Is Electromagnetic Wave	19

CHAPTER 1

INTRODUCTION

1.1 Introduction

The variety of laser application developed since 1960 is very wide. Until 1917, no one conceived that there was a basic process that allow light to be amplified as it is in laser. Albert Einstein showed that the process of stimulated emission must exist, and from that time the invention of laser was possible. Many materials were investigated as the active laser medium, including impure crystals, semiconductors, ionized gases, molecular gasses and dye solution. T.H. Maiman obtained the laser action obtained in a mixture of helium and neon gases. [1]

The laser sits near the top of any list of the greatest inventions of the last half of the twenty first centuries. Together with the satellite, the computer and the integrated circuit, it is a symbol of high technology. Like the other technologies, laser affects our lives in many ways and is growing steadily importance. Laser technology is both fascinating in itself and an important tool in fields from medicine to communication.[2]

1.2 Scope of the Thesis

Infrared technology is well suited to high data rates. Optical free-space laser communication systems are wireless connection through the atmosphere by using light. Advances in producing the process of high quality laser modules either in digital signal processing and in the study of light propagation through atmosphere has drastically improved the utilization of light as information medium.
