

VISUAL AND GEOLOCATION ENABLED WIRELESS EMERGENCY
NOTIFICATION SYSTEM USING EMBEDDED INTERNET OF THING DEVICE

This thesis is presented in partial fulfillment for the award of the
Master of Science in Telecommunication and Information Engineering
UNIVERSITI TEKNOLOGI MARA

SHAZRIN IRDA BINTI EZANEE

**MSc IN TELECOMMUNICATION AND INFORMATION
ENGINEERING**

FACULTY OF ELECTRICAL ENGINEERING

UNIVERSITI TEKNOLOGI MARA

40450 SHAH ALAM, SELANGOR

ACKNOWLEDGEMENT

First of all I would like to praise to Allah Al-Mighty for giving me the strength and blessing to complete this project for my master course. My research project would not possible without help from others. The first person I would like to gratitude my thanks is to my supervisor, Assoc. Professor Dr Azlina Idris for the endless support, guidance and continuous encouragement throughout to complete this project.

My special thanks also go to my husband, parents, all family members, classmate and friends who are contribute throughout to complete this research project. I also would like to take the opportunity to thanks to UiTM for giving me a chance to participant in Invention Innovation Design Competition 2016 organized by FKE UiTM 2016 and win for “Gold” award. Their opinion and criticized is really valuables to use in future.

Last but not least, a big thanks to everyone who have contributed in my mission to complete my research project. Thank you so much.

ABSTRACT

This project developed an intelligent street light with several smart features such as, WI-FI module, GPS, and HD Camera. The biggest problem that contributes to the existence of this technology is to upgrade the system from manual to automatic system by eliminates the hotline calls between citizen and emergency responder. In order to achieve the Internet Telecommunication Union (ITU) standard requirement toward Smart city, using Internet of Thing is one of the requirement. For system improvement, this research is focusing to automate all the manual system (hotline call method) to online based method using Raspberry Pi 3. The main system are using WI-FI module and a few features such as GPS is for location and co-ordinate while the HD Camera is function is to live stream the accident through the monitoring website for reporting to the rescue team. Overall view of the project is positive impact is making thing more easier and value added to the citizens because system is automated and it can be contribute to the any contractor that relate with engineering and construction company , emergency responder (MERS 999) and any others company that involve with government project. As a result, the comparison between manual system and the propose system is improved 88.8 %. The result shows that the improvement is beyond 50%. Overall system has the ability to contributed positive impact to societies and can benefit the citizens in term manual system transform into automatic system which all the system can be operate automatically and user friendly.

	PAGE
ACKNOWLEDGEMENT	I
ABSTRACT	II
TABLE OF CONTENTS	III
LIST OF FIGURE	IV
LIST OF TABLES	VII
LIST OF ABBREVIATION	VIII
CHAPTER 1	
INTRODUCTION	1
1.0 Background of Study	1
1.1 Problem Statement	2
1.3 Significant of Study	4
1.4 Objective	5
1.5 Scope of Project	6
1.6 Thesis Organization	6
CHAPTER 2	
LITERATURE REVIEW	7
2.0 MERS 999 Reporting System Structure	10
2.1 Automatic Reporting System Main Component	11
2.2 Others Hardware Component	14
CHAPTER 3	
METHODOLOGY	19
3.0 Introduction	10
3.1 Flow cart Of the System	21

	3.2 Auto Reporting System Design	20
	3.3 Wi-Fi System Network	21
	3.4 Website Page Monitoring System	22
	3.5 Programming Script	23
	3.6 Wamp Server	32
	3.7 Web design	32
CHAPTER 4	RESULT AND DISCUSSION	34
	4.1 Introduction	34
	4.2 Online Testing Result	36
	4.3 Power Consumption	36
CHAPTER 5	CONCLUSION & FUTURE RECOMMENDATION	45
	5.1 Conclusion	46
	5.2 Future Recommendations	46
	5.3 Commercialization	46
	5.4 Contribution	47
