UNIVERSITI TEKNOLOGI MARA

Forecast of Muslimah Fashion Trends in Caca's Company

Muhammad Saifullah Bin Mohd Taip

Thesis submitted in fulfilment of the requirement for Bachelor of Information Technology (Hons.) Business Computing Faculty of Computer and Mathematical Sciences

ACKNOWLEDGEMENT

First and foremost, I would like to sincerely thank and special appreciation goes to my lecturer, Madan Norulhidayah binti Isa, who has guided, patience and support to complete this project. It has been a great pleasure and honour to have her as my course instructor. Alhamdulillah, praise and thanks to God, the Almighty, for His blessings that helped me finish this job effectively throughout my work. First of all, I would like to thank my supervisor (Ts. Dr.) Ahmad Faiz Ghazali, for his time, assistance, and guidance in assisting me to complete this assignment.

Alhamdulillah, all praises to Allah for the strengths and His blessing in completing this assignment. The success and final outcome of this assignment required a lot of guidance and assistance from many sides of people.

I also want to extend my deepest gratitude goes to all of my family members for their support and encouragement throughout my study. It would not be possible to write this project without the support from them.

Finally, I would sincerely like to thank all my beloved friends who were with me and support me through thick and thin.

ABSTRACT

Alhamdulillah, thanks to Allah, nearly all businesses now require business intelligence technologies in the quickly expanding globalisation era. The development of the best practical strategy by a corporation depends on business intelligence, caca company that provides different types of Muslim clothes. This store is facing some problems due to lack of methods predict their sales, so stores can overstock certain products leading to loss to the company, problems like this occur when the management cannot make a budget exact amount. This predictive analysis is carried out to learn future predictions about the classification of each outfit, its colour, and its size, and the project begins with the study's first data collection and exploration before putting data mining activities into practise. In this study, researchers measured weekly sales pattern performance accuracy findings using two different methodologies. There are roughly 2068 data collected from May to September 2022. In this scenario, it will lower expenses, particularly for product production, utilities, and maintenance. By putting the approach into practise, it will assist the management team in making the fundamental decision to develop the product in order to avoid losses. Researchers are using CRISP-DM as their method for finishing the current project. These findings will be displayed on the execution dashboard. The results showed that the decision tree algorithm had a higher accuracy of 100% for category prediction, 47% for colour prediction, and 65% for size prediction, while the random forest algorithm had a higher accuracy of 100% for category prediction, 85% for colour prediction, and 91% for size prediction. The dashboard was created to make it simple for people to understand trends. In conclusion, BI may assist businesses in locating and fixing issues.
