## ABSTRACT

Non-communicable diseases (NCD), which are related to unhealthy lifestyles, cause a high proportion of deaths across the globe. This calls for a participatory sensing solution that may significantly expand access to healthcare to more people. Participatory sensing allows citizens to monitor activities, while enabling researchers and stakeholders to collect, analyse, and share local knowledge. However, in the absence of adequate participation, the participatory sensing system will fail to collect meaningful findings for decision making. Recent developments in the field of incentives have led to a renewed interest in non-monetary strategies to improve participants' performance. Nevertheless, most of the studies typically addressed the extrinsic incentives and largely overlooked the intrinsic aspect of the non-monetary incentives, thus losing the potency to fulfil the needs of the data contributor holistically. The inadequacy creates a false impression that technology designers cannot demonstrate intrinsic incentives in the participatory sensing system. Consequently, there is limited knowledge on the implementation of various non-monetary incentives in a mobile health monitoring campaign. For these reasons, this thesis proposes a non-monetary incentive in participatory sensing (NIPS) framework, which addresses both intrinsic and extrinsic incentives. The framework is evaluated in a mobile health setting. This study connects quantitative and qualitative data using sequential explanatory mixed-method research designs, drawing on three research objectives: 1) to determine the theory-driven constructs as part of the proposed non-monetary incentive framework through theoretical study and survey analysis of 301 respondents; 2) to design incentive mechanics that demonstrate the non-monetary incentives constructs through the content analysis of 283 apps; and 3) to evaluate the effect of non-monetary incentive framework towards participant performance through a case study in mobile health participatory sensing campaign. The validation result showed that the proposed framework is practical to be executed in the mobile health setting. Findings showed that non-monetary incentives, particularly of intrinsic value, could be effective to reinforce participant performance in participatory sensing data collection. This study contributes to the body of knowledge of participatory sensing in two ways: extending the Self-Determination and Motivation 3.0 theories in participatory sensing setting, and extending the literature of incentives research area. From practical perspectives, this study aids system developers to improve participatory sensing system features, helps campaign organisers in participant recruitment and health campaign evaluation, and assists health practitioners and policy makers in decision making.

## ACKNOWLEDGMENT

First and foremost, I am very grateful to Allah the Almighty. All praises to Allah, for lending your guidance, ideas, strength and patience to complete this thesis. From the bottom of my heart, I want to thank you for being with me all the way, for never leaving me, and for blessing me.

I would like to express my sincerest gratitude to my main supervisor, Assoc. Prof. Dr. Wan Adilah Binti Wan Adnan for your excellent guidance, tremendous support, and patience. Most importantly, thank you for understanding my work and my vision. Thank you to my co-supervisor, Prof. Dr. Rabiah Binti Ahmad, who keeps things in perspective, and for your continuous support and concerns. Prof. Dr. Saadiah Binti Yahya, my former supervisor, I could not have finished my PhD journey without your encouragement and life lessons.

I would like to convey my indebtedness to each one of my research participants and respondents, without this thesis would be moot. Your thoughts and insights constitute the essence of this study I would like to thank the knowledge and domain experts, industry expert, translators, and proofreader, who provided their insights on this study. Their fruitful comments and suggestions are utmost important to my study. I wish to express my appreciation to my mock-viva panel, Prof. Dr. Nor Laila Binti Md Noor and Dr. Emma Nuraihan Binti Mior Ibrahim for their constructive input.

I wish to thank my friends and colleagues who offered their support throughout the period of the study. A special thanks to Dr. Muhammad Haziq Lim Abdullah, Dr. Fahmi Arif, Farah Nabilah Binti Mahmud, Dr. Nurul Azma Binti Zakaria, Dr. Mohd Zaki Bin Mas'ud, Zakiah Binti Ayop, Yahya Bin Ibrahim, Dr. Zaheera Zainal Binti Abidin, Dr. Hafiz Bin Zakaria, and Dr. Gede Pramudya Ananta for their constructive discussions and helps with the analysis and in thesis writing during the course of this study. Additionally, I would like to acknowledge Head of Computer Systems and Communications Department, Dr. Siti Rahayu Binti Selamat and Dr. Wahidah Binti Md Shah, for facilitating my PhD journey.

Further, I wish to acknowledge the valuable contributions of panel of examiners, Dr. Wan Abdul Rahim Bin Wan Mohd Isa, Assoc. Prof. Dr. Nor Azman Bin Ismail, and Prof. Dr. Lorna Uden. Their fruitful comments and suggestions regarding the improvement of quality, coherence, and content presentation of this thesis are utmost important, which I have gladly embraced.

Finally, but not least, I would like to express my gratitude to my mother, my mother in law, and my beloved family members for their continuous understanding, prayers, patience and supports throughout my five years of difficult endeavor.
