ABSTRACT

The purpose of this research is to conduct the investigation for product quality using Finite Element Method (FEM) – based simulation or virtual manufacturing (VM). Understanding the VM process will significantly assist the production to minimize defects, reduce manufacturing cost of new product development and improve quality of the finished products being produced by several continuing processes. FEM - based VM approach is used to predict final dimensional change in both forming and welding processes through the utilization of specialized manufacturing software Simufact.Forming and Simufact.Welding. This research consists of case studies which are aimed on chained process from stamping to welding. The first case study is to practice FEM simulation and experimental investigation on distortion of butt-joint welding with defined clamping force for verification purpose. Experimental butt-joint welding was joined by means of robotic welding system (ABB IRB 2400/16) and advanced power source (KEMPPi ProEvolutionProMig) with mixed shielding gas 80% Ar/ 20% CO₂ as well as filler wire ER70S. It was also demonstrated that VM shows good agreement during the experimental verification. In the second case study, investigation of chained process quality for product design with the purpose to demonstrate the accuracy in predicting final geometry in chaining processes where the physical properties from the first process serves as the initial condition of the second process. The parameters for simulation study were obtained from manufacturing companies with sheet metal material of low carbon steel SPH440, thickness of 2 mm, Young Modulus of 210 MPa and Manganese composition of 1.1%. The third case study dealt with FEM analysis of chained process from stamping to welding. The stamping effect of distortion behaviour will be continued in fourth case study with welding process. Through this research, the impacts of chained process could be predicted and Taguchi Method was used for optimization. In the first case study of FEM simulation and experimental investigation on distortion of butt-joint welding, the error range of the comparison result on distortion yields the value of 11.331% in average. In the second case study, the error range on final geometry in chaining processes is found out to be 4.42% in average. In the case of chaining processes Stamping-to-Welding in case study 3, the percentage of difference between chaining and unchaining are 37.7% which provides an overview of a difference between these two processes. Finally, the fourth case study shows that the distortion in chained process is closer to real distortion than unchained process with percentage of difference of 72.6%. It can be concluded that the VM method can be applied at manufacturing industries to improve the product quality by predicting defects in design phase before the actual manufacturing process due to commence. As further recommendation, the application of FEM as one of the ninth pillars of Industrial Revolution (IR) 4.0 can be enhanced in advanced materials, other coupled processes and geometries as well as other conditions.

ACKNOWLEDGEMENT

Firstly, I wish to thank The All-Mighty God, Allah SWT for giving me the opportunity to embark on my PhD and for completing this long and challenging journey successfully. My gratitude and thanks go to my supervisor Prof. Ir. Ts. Dr. –Ing. Yupiter HP Manurung IWE/EWE/SFI CEng IMechE, for the continuous support of my Ph.D study and related research, for his patience, motivation, and immense knowledge. His guidance helped me in all the time of research and writing of this thesis.

I would also like to convey my deep appreciation to Prof. Ir. Dr. Hj Abdul Rahman Omar, former Deputy Vice Chancellor for Research and Innovation as my second supervisor for his valuable and constructive suggestions during the planning and development of this research work.

My appreciation goes to the the technicians and staffs at the Smart Manufacturing Research Institute (SMRI) of the School of Mechanical Engineering at UiTM Shah Alam for their help in offering me the resources in running the experiments, who gave access to the laboratory and research facilities. Without their precious support it would not be possible to conduct this research.

Finally, this thesis is dedicated to the loving memory of my very dear late father and late mother for the vision and determination to educate me. This piece of victory is dedicated to both of you. Alhamdulillah.

CONFIRMATION BY PENAL OF EXAMINERS	ii
AUTHOR'S DECLARATION	iii
ABSTRACT	iv
ACKNOWLEDGEMENT	v
TABLE OF CONTENTS	vi
LIST OF TABLES	ix
LIST OF FIGURES	xi
LIST OF SYMBOLS	xiii
LIST OF ABBREVIATIONS	xiv
LIST OF NOMENCLATURE	xvi
CHAPTER ONE: INTRODUCTION	1
1.1 Research Background	1
1.2 Problem Statement	3
1.2 Objectives	4
1.3 Scope of the Study	4
1.4 Significance of Study	6
CHAPTER TWO: LITERATURE REVIEW	8
2.1 Definition of Chained Manufacturing Process	8
2.2 Product Design	8
2.2.1 Product Design Quality	11
2.3 Stamping Process	12
2.4 Welding Process	15
2.4.1 Fusion Welding-GMAW	16
2.4.2 Power supply for GMAW	18
2.4.3 Distortion Theory in Gas Metal Arc Welding Process	18

2.4.4 Heat Input & Heat Source	23
2.5 Residual Stress – Cooling Time and Distortion	25
2.5.1 Clamping Forces	25
2.5.2 Cooling Time and Cooling Fixture	25
2.6 Virtual Manufacturing	26
2.6.1 Virtual Manufacturing Application using Finite Element Methods	28
2.6.2 Thermo-mechanical analysis using FEM-based Virtual Manufacturing Simulation	29
2.6.3 Prediction of Stamping Spring Back by using FEM	32
2.6.4 Prediction of Welding Distortion by Using FEM	34
2.7 Taguchi Method	40
2.8 Research Gap	43
2.9 Summary of Literature Review	45
CHAPTER THREE: RESEARCH METHODOLOGY	46
3.1 Introduction	46
3.2 Research Flow Chart	46
3.2.1 Phase 1: Modelling and Simulations	47
3.2.2 Phase II: Experimental Study	48
3.2.3 Phase III: Result Comparison and Thesis Writing	48
3.3 Case Study 1: Study the Capabilities of FEM Simulation and Experimental Investigation on Distortion of Butt-Joint Welding With Defined Clamping Force	48
3.3.1 Geometrical Modelling of Butt-Joint	49
3.3.2 Procedures Using Finite Element Method in Welding Simulation	50
3.3.3 Experimental Set up and Procedures	53
3.4 Case Study 2: The comparison between Finite Element Analysis of Rear Arm Spring back with Experimental Verification in Stamping Process at Oriental Summit Industries Sdn Bhd	55
3.4.1 Geometrical Modelling of Die-stamping	56
