## **ACKNOWLEDGEMENT**

Alhamdulillah, all praises, glory and thanks to Allah, the almighty Lord of the world. Peace and blessing to Prophet Muhammad S.A.W., all the Prophets, his families and all Muslim's.

I would like to express my special appreciation, gratitude and thanks to my supervisor, Mr. Fazrul Razman Bin Sulaiman for his guidance and advice throughout the process of this study. I will always be grateful to Mr. Fazrul's advice and guidance on experimental design, detailed assistance, and kind encouragement. Without his continued support and interest, this thesis would not be same as presented here.

In addition, I would especially thanks to the coordinator for this course Dr. Aiza Binti Harun and all the lab assistants at Faculty of Science Laboratory UiTM Pahang who also has contribute to the success of this study.

Last but not least, I would like to express the deepest appreciation to my parents, for their endless pray, support and encouragement throughout this study.

Sairah 'Atiqah Binti Mohd Nasir

## **ABSTRACT**

### **COMPOSITION OF SELECTED HEAVY METAL IN RAINWATER**

#### **COLLECTED FROM UiTM PAHANG**

Pollutant derived from anthropogenic activities impact significantly on heavy metal composition in rainwater. To measure the composition of heavy metal in rainwater and to identify the possible source and relative contribution of heavy metal in rainwater 16 rainwater samples from four different sampling stations in UiTM Pahang were collected. In this study, the determination of the composition of heavy metal Zn, Cu and Fe were performed on 16 rainwater samples collected at UiTM Pahang. Samples were collected by using high density polyethylene bottle from October to November 2014 at four sampling station around UiTM Pahang. The composition of heavy metal in the filtered samples was determined with GFAAS for ( Cu and Zn) and FAAS for (Fe). The pH ranged from 6.12 to 6.35. Based on the study, average mean concentration of the selected heavy metal for the whole sampling station were found to be  $80.86 \pm 128.27$  ( $\mu\text{g/L}$ ) for Zn,  $45.44 \pm 13.18$  ( $\mu\text{g/L}$ ) for Fe and  $4.347 \pm 2.42$  ( $\mu\text{g/L}$ ) for Cu. The concentration of selected element obtained from four sampling station were ranks as follow  $\text{Zn} > \text{Fe} > \text{Cu}$ . Crustal enrichment factors (EF) related to the relatives abundance material was calculated by using Fe as reference element and top soil as reference sample. The EF indicated that all sampling station were not enriched with heavy metal as the EF value obtain from the whole sampling station were less than 2, which shows that the sampling area were categorized in deficiency to minimal enrichment. The EF value also indicates that the present of heavy metal in collected rainwater samples are originated from natural sources.
