## **ACKNOWLEDGEMENT**

I would like to extend my sincere gratitude to my research supervisor; Mr. Saiful Firdaus bin Abdul Shukor for his assistance and guidance towards the progress of this thesis project. Throughout the year, Mr Saiful has been patiently monitoring my progress and guided me in the right direction and offering encouragement. Obviously the progress I had now will be uncertain without his assistance.

Special thanks must also go to the laboratory technicians, for allowing me to use the computer in the lab.

Lastly but not least, my special appreciation and thanks to my beloved family for giving me support, which is the key element in pushing me forward the peak of success.

Thank You.

## ABSTRACT

This thesis discussed the 'Study of State Response of DC Motor using MATLAB/SIMULINK'. It consists of the open loop system and close loop system. The speed control method of the DC Motor is investigated through open loop system by changing the namely field resistance, armature voltage and armature resistance. The close loop system or feedback system is investigated by using the PI controller and Fuzzy controller.

There are two controllers that used to reduce the steady state error between the measured speed motor and the reference speed. The PI controller firstly implemented to investigate the performance of the operating condition. After that the Fuzzy has been used to replace the PI controller to compare the differences of the operating conditions.

Finally the MATLAB/ SIMULINK models were developed to examine the DC Motor. It is developed by using the model of separately excited DC motor. Finally, results are comparing to get the expected results as theoretically.
