## ACKNOWLEDGEMENT

*~In the name of Allah, Most Beneficent, Most Merciful~*

All the praises and thanks to Him, the Lord of the universe and peace be upon His messenger Muhammad S.A.W, the last of the prophets and the righteous followers. I would like to express Syukur Alhamdulillah for the patience, strength, perseverance and motivation towards the accomplishment of this project.

I would like to express my countless appreciation and gratitude to my final year project supervisor, Assoc. Prof. Dr. Ismail Bin Musirin for his continual guidance and invaluable ideas and advice which has helped me tremendously in completing this project. Thank you for accepting me as your final year project supervisee.

I would like to express my deepest thanks to all my colleagues or course mates in UiTM especially to all the PLK students who had shared with me their valuable knowledge and advice in Electrical Engineering towards the completion of this project.

My gratitude also goes to all lectures in Faculty of Electrical Engineering, UiTM and to those who have devoted their time either directly or indirectly, for their ideas, support and contribution towards the success of this project. Last but not least, to all my family members and to both of my parents, En. Pardi Bin Marto and Pn. Misnah Binti Rajak for their understanding and support throughout the years. All of you are the source of my strength and inspiration.

“May Allah bless and reward them for their generosity”.

Junainah Binti Pardi  
Universiti Teknologi MARA, Shah Alam

## ABSTRACT

Distributed generator (DG) is playing major role to supply energy resources and also for the development of co-generation plant which is absolutely very important in the electric power systems of the near future. The study involved in this project is to determine the optimal allocation and sizing of the DG in order to minimize the losses in the system.

Fast Voltage Stability Index (FVSI) technique has been used with the objective to identify the suitable location for the distributed generation in the networks. FVSI is used as the measuring instrument in predicting the sensitive lines which will be used to identify the location for DG installation. Once the locations are determined, Particle Swarm Optimization (PSO) technique is developed to identify the optimal size of the DG. It is an algorithm that represents the behavior of a flock of birds or a school of fish.

The feasibility of the proposed method is considered by using the fitness function in PSO technique to solve the load flow calculations for decision-making. In order to realize all the proposed technique, MATLAB programming software is used to develop the programming codes. The effectiveness of the proposed technique has been validated on standard IEEE 12-bus distribution system.

The obtained results show that the choice of the optimal locations and sizing of the DGs in the distribution system had minimized the total loss.

*Keyword:* Fast Voltage Stability Index (FVSI), Optimal allocation of DG units, Particle Swarm Optimization (PSO)
