**CHEMICAL ACTIVATION OF
BAMBOO ACTIVATED CARBON
(BAC) BASED ON MICROWAVE-
ULTRASONIC ACTIVATION FOR
SUPERCAPACITOR APPLICATION**

Master of Science

Faculty of Chemical Engineering

January 2018

ABSTRACT

Activated carbon (AC) has been explored as a raw material for supercapacitor due to its characteristic of having porosity and electrical conductivity, which could liberate a high power. From high surface area and pores size, it leads to a high specific capacitance values more than 70 F/g. High adsorption capacities of AC are determine by pore volume, porosity and surface area. Thus, this present study was focused on the chemical activation and microwave-ultrasonic (Mw-U) activation in order to enhance the properties of AC derived from bamboo. Bamboo has been choose as raw material because it is economical, easy to get and have high total pore volume distributed in the micropore range. BAC was activated using potassium hydroxide (KOH) with different Mw power intensity (100 W, 300 W, 500 W) at 30 minutes of retention time and 60 minutes of soaking time under ultrasonic. The carbonisation process was conducted at temperature 400°C, 600°C and 800°C. Bamboo physical and chemical properties gave a good impact to the BAC performance, which was consist a low of moisture content (0.4%) and high of carbon content (83.4%). KOH activation and Mw-U activation at 500 W produced high surface area, 106.65 m²/g with total pore volume 4x10⁻² cm³/g. BET value of surface area is 646.87 m²/g and total pore volume is 2.8x10⁻¹ cm³/g conducted with power intensity of Mw 100 W at 800°C of carbonisation temperature. The capacitance value is analyse under electrochemical analyses, which cyclic voltammetry (CV) and galvanostatic charge and discharge (CDC). The value of specific capacitance, Cs of BAC is 77 F/g at scan rate 25 mV/s in 1 mol/L KOH of electrolyte is produced from CV. While for galvanostatic CDC, the specific capacitance, Cs is 80 F/g at current density, 0.3 Ag⁻¹ of BAC. Hence, it can concluded that BAC capable be used as alternating method in producing AC for supercapacitor.

ACKNOWLEDGEMENTS

بِسْمِ اللَّهِ الرَّحْمَنِ الرَّحِيمِ

Firstly, I wish to thank God for giving me the opportunity to embark on my Master and for completing this long and challenging journey successfully. I would like to express my deepest gratitude to my supervisor, Dr Fazlena binti Hamzah for constant support, kind guidance, patient discussion and valuable suggestions in carrying out the research project. Thank you so much for your great patience and tolerance during the entire course of my Master study. I would also like to thank my co-supervisor, Madam Mahanim binti Sarif for her valuable guidance throughout this research.

I would like to express my profound thanks to my wonderful group mates and friends for their generous help in laboratory, research projects and daily life. Not forgotten, million thanks to the all laboratories assistances and crewmembers of Faculty Chemical Engineering postgraduate who provided the facilities and assistance in helping me through this research project.

Last, but the most important, I wish to express my appreciation to my family. I would like to thank my dear parents, my late father, Encik Mohd Zawawi bin Mahusain and my mother, Puan Fatimah binti Mohamad for their loves and endless supports. Hence, I also would like to thank all the other family members for their continuous support for my MSc journey.

Alhamdulillah.

Thank You.

TABLE OF CONTENTS

	Page
CONFIRMATION BY PANEL OF EXAMINERS	ii
AUTHOR'S DECLARATION	iii
ABSTRACT	iv
ACKNOWLEDGEMENTS	v
TABLE OF CONTENTS	vi
LIST OF TABLES	ix
LIST OF FIGURES	x
LIST OF SYMBOLS	xii
LIST OF ABBREVIATIONS	xiv
CHAPTER ONE: INTRODUCTION	1
1.1 Research Background	1
1.2 Problem Statement	4
1.3 Significant of Study	6
1.4 Scope and Limitations	6
1.5 Objectives	7
1.6 Hypothesis	7
CHAPTER TWO: LITERATURE REVIEW	8
2.1 Activated Carbon and Its Characteristic	8
2.1.1 Porosity	8
2.1.2 IUPAC Classification of Adsorption Types	11
2.1.3 Crystalline and Amorphous Structure of AC	15
2.1.4 Surface Area of AC	16
2.2 Types of AC	18
2.3 Raw Material for Activated Carbon	19
2.3.1 Agricultural Waste as AC	20
2.3.2 Bamboo as AC Precursor	23
2.4 Activated Carbon Processing	26

2.4.1	Physical Activation	26
2.4.2	Chemical Activation	29
2.4.3	Microwave (Mw) Activation	32
2.4.4	Ultrasonic Activation	38
2.5	Supercapacitor as Energy Storage	41
2.5.1	AC in Supercapacitor Application	43
2.6	Summary	47
CHAPTER THREE: METHODOLOGY		49
3.1	Raw Material Preparation	49
3.2	Preparation of Activated Carbon	50
3.2.1	Chemical Activation Preparation	50
3.2.2	Bamboo Activated Carbon (BAC) Parameter	51
3.3	Characterisation Analyses	52
3.3.1	Thermogravimetric Analyses (TGA)	52
3.3.2	Elemental Analyses Spectroscopy (EA)	53
3.3.3	Fourier Transform Infrared Spectroscopy (FTIR)	54
3.3.4	Brunauer, Emmett, Teller (BET) Test	54
3.3.5	Field Emission Scanning Electron Microscope (FESEM)	55
3.3.6	X-ray diffraction (XRD)	55
3.4	Electrochemical Measurement	56
3.5	Outline of Research Study	58
CHAPTER FOUR: RESULT AND DISCUSSION		59
4.1	The Effects of Chemical Agent Activation	59
4.2	Characterisation of AC Precursor	60
4.2.1	Proximate and Ultimate Analyses of Bamboo Raw Material	61
4.2.2	FTIR Analyses of Raw Bamboo	62
4.2.3	Morphology of Raw Bamboo	63
4.3	Proximate and Ultimate Analyses of BAC	64
4.4	Graphitisation of BAC	66
