AUTOMATIC EAR RECOGNITION UNDER  
VARYING ILLUMINATION

ALI ABD ALMISREB

MSc

January 2012

## **Abstract**

Recognition systems grow rapidly and there are many recognition systems that have been investigated such as iris systems, fingerprint systems, face detection systems and many others. In this thesis, we created ear database under variant distances and illumination environment consisting of 200 images from fifty persons. In addition, we identified a new ear segmentation approach which is able to extract the ear section despite of the distance and illumination of the captured ear image. The processes to segment the ear sections are Biased Normalized Cuts, image adjustment, entropy, thresholding, skeletonizing, image filling, image opening and substitution. Then, we enhanced the ear recognition rate. For feature extraction, we used 1D log-Gabor filter to generate an ear code and hamming distance is utilized as matching algorithm. Subjective evaluations showed that our proposed system managed to achieve 95% for ear segmentation rate and 96.662% for ear recognition rate.

## Acknowledgement

Praise be to ALLAH the Almighty, who has granted us the serenity of belief in Islam, and peace be upon *Prophet Muhammad* who has guided mankind from darkness to light.

The creation of a project like this dissertation is never an isolated endeavor. To move from imagination to have a successful thesis required the encouragement, support, assistance, and understanding of many individuals. A thesis like this one, is a product of many minds and many hands. With grateful heart, I owe a great debt to my supervisor *PM. Dr. Nursuriati Jamil*, who offered good advice, constructive criticism, provided a lot of information and for her encouragement and wholehearted support.

It is my pleasure to acknowledge *Dr. Noor Elaiza* and *Dr. Sharifa Lillah*, who assisted me in many ways during the presentation of this thesis and for constant motivation to reach ahead and broaden my horizon. May *ALLAH (SWT)* accept their well-intentioned efforts and reward them generously.

I would like to render special thanks to my lovely family and kindhearted friends, who have ever been so patient and understanding, as I spent countless hours buried in my books and glued to my computer. They were there for me, assisting in every way that they can serving as on-the-spot trouble shooters and technicians when laptop and printer got too tired to cooperate, etc. They were deprived of many precious moments and quality time as I did overtime work not only five times but a couple of times. Their boundless patience and understanding keep me going.

I also wish to express my gratitude to my good friend *Sakeenah Aisha* who inspired and motivated me to struggle to finish this dissertation.

Above all, thanks and praises be to *ALLAH* Almighty who has created the creation and made man to be the pinnacle of *HIS* Divine art, who also revealed mankind divine knowledge, sincerity, and piety. *HE* is the source of all knowledge, understanding and wisdom. *HE* called me to write, gave me the opportunity and enabled me to write with *HIS* inspiration and guidance.
