ABSTRACT

Stevia rebaudiana Bertoni leaves contain non-caloric natural sweet compounds which are steviol glycosides. Stevioside and rebaudioside A are types of steviol glycosides that are the most abundant in the leaves. The aims of this study are (1) to characterize and evaluate morphological characteristics of ten stevia accessions. (2) to obtain an LC-MS profiling of stevia leaves extract and quantify major constituents of steviol glycosides and identify other major compounds that presented in the stevia leaves extract (3) to determine the effect of different harvesting stages towards stevioside and rebaudioside A. The leaves were extracted using Soxhlet extractor and analysed using LC-MS for profiled. Due to environmental factors, ten accessions showed different morphological characteristics. Before flowering stage, accession Bangi had showed high dried yield leaves, $0.72\pm 0.01\text{g}$. Accession Bertam produced number of leaf 25 ± 2.0 per plant. Accession MS012 (4X) had a good characteristic on the plant height, $22.6\pm 1.0\text{cm}$ before flowering stage. Most of accession showed the length of leaf varied from 6.5cm to 7.3cm. The profiles of stevia extracts showed that presence of major constituents steviol glycosides in stevia extracts which were $[\text{M-H}]^-$ m/z 803 (stevioside) and 965 (rebaudioside A). The content of stevioside was found abundant in the extract accession MS023 before until late flowering stage, respectively with 2.14% and 2.40%, respectively. Meanwhile rebaudioside A content was found abundant in the extract of accession Bertam that harvested from before until late flowering stage, respectively with 0.60% and 0.69% respectively. Based on the LC-MS profiling, accession Bertam and MS023 are considered to have high stevioside and rebaudioside A contents and can be applied for future breeding programme to enhance the economical value of stevia for farmers.

ACKNOWLEDGMENT

Alhamdulillah, Thanks to Allah S.W.T., whom with His willing giving me the opportunity to complete this master research. Firstly, I would like to express my highest gratitude to my supervisor, Dr. Nor Azma Binti Yusuf and my co-supervisor Professor Datin Dr. Rohaya Binti Ahmad for giving me a lot of new experiences, exposures and knowledge from beginning till the end of this master research.

Their suggestion, guidelines and advices in learning process are highly appreciated. They taught and helped me a lot for the smoothness and progression of my research. I also would like to thank all staff of Faculty of Plantation and Agrotechnology, Faculty of Applied Sciences and Atta'ur Rahman Institute for Natural Products Discovery (RiND) science officers, and all laboratory assistants last but not least Agilent Technologies for their efforts, time and sharing knowledge in helping me throughout this research. Deepest appreciation also goes to my former supervisor Professor Dr. Mohamad Osman for inspired, cooperation, and helping during progression of my research. It was an honour for me to extend my special thanks to my beloved parents, Arshad Yaacob and [REDACTED] and my friends for their loves, encourage and endless support to help me in overcome the tribulation, sacrifice and problems arise throughout completing this research.

Last but not least, I offer my regards and blessing to all those people who had contributed either directly or indirectly in this project and helping me in any respect during the completion of this project. Thank you for all your kindness. May Allah bless all of us in this world and hereafter.
