**AN INTERNET OF THINGS BASED
FOR SMART RECYCLE WASTE
CLASSIFICATION**

AKMAL BIN MD NASIR

BACHELOR OF COMPUTER SCIENCE (Hons.)

JULY 2023

ACKNOWLEDGEMENT

Alhamdulillah, praises and thanks to Almighty Allah because of His utmost blessings, mercy and guidance in giving a full strength to me to finish this project within the time given. Firstly, special thanks to my supervisor, Madam Rosniza binti Roslan for guiding and supervising me throughout this research being conducted.

I also would like to express my deepest thanks to my lecturer, Dr Noor Hasimah binti Ibrahim Teo, for teaching us every single step in writing and presenting this project in a professional way. I also want to thank my examiner, Dr Ahmad Firdaus bin Ahmad Fadzil for pointing out the mistakes in my project and for providing feedback and suggestions on how to make it better. A word of gratitude also goes out to all lecturers that had taught me during my study at UiTM Jasin. Without them, my project would not have been completed.

Special thanks to my parents, Md Nasir bin Adi and Noor Hasimah binti Mohd Zabidi who has been my pillar of strength and support for me in terms of the financial and motivation while also providing me moral support during difficult times. Their enthusiasm assists me a lot throughout this final year project journey. I am taking this opportunity to give my gratitude to my friends that together helped me in giving me a constant encouragement while doing this project. I am extremely grateful to have so many great people around me.

ABSTRACT

Innovative solutions utilising modern technologies have been created in response to the growing global concern for effective waste management and recycling practises. This thesis introduces a smart recycle waste categorization system built on the Internet of Things (IoT) with the goal of automating and improving waste sorting procedures. To accurately categorise waste into the categories of metal, paper, plastic, and maybe other waste types, the system uses an image classification model based on the ResNet algorithm. A large dataset that included a range of waste images was aquired in order to train the classification model. With a high accuracy rate for waste classification, the ResNet algorithm proved to be effective. Real-time monitoring of the smart bin's capacity is made possible by the integration of IoT capabilities, and users of the Blynk app receive notifications through email as a result. The suggested system provides a dependable, automated, and flexible alternative to the drawbacks of traditional waste sorting techniques. The approach improves waste sorting accuracy by extending the classification model to incorporate additional waste types and adding a "reject" class for unclassifiable or irrelevant images. As a result, recycling procedures are enhanced, and sustainable waste management is promoted. The results of this study show how the Internet of Things and image classification algorithms have the potential to rerevolutionize arbage classification and management. An effective way to streamline waste sorting procedures and enable effective recycling techniques is to deploy the smart recycle waste classification system. This technology is expected to significantly influence waste management initiatives, fostering sustainability and environmental protection.

TABLE OF CONTENTS

CONTENT	PAGE
TABLE OF CONTENTS	ii
LIST OF FIGURES	iv
LIST OF TABLES	v
LIST OF ABBREVIATIONS	vi
CHAPTER ONE: INTRODUCTION	
1.1 Background of Study	1
1.2 Problem Statement	2
1.3 Objectives	3
1.4 Scope	3
1.5 Significance	4
1.6 Outline of Thesis	5
CHAPTER TWO: LITERATURE REVIEW	
2.1 Introduction	7
2.2 Sustainable Development Goals	7
2.3 Recycling	7
2.3.1 Recyclable Waste	9
2.3.2 Non-recyclable Waste	13
2.4 Internet of Things	16
2.4.1 Coding Layer	17
2.4.2 Perception Layer	17
2.4.3 Network Layer	18
2.4.4 Middleware Layer	18
2.4.5 Application Layer	19
2.4.6 Business Layer	19
2.5 Image Processing	19
2.5.1 Pre-Processing	20

2.5.2	Processing	20
2.5.3	Post-Processing	21
2.6	Image Classification	22
2.6.1	Artificial Neural Network (ANN)	22
2.6.2	Convolutional Neural Network (CNN)	22
2.6.3	Deep Convolutional Neural Networks (AlexNet)	23
2.6.4	Networks Using Blocks (VGG)	24
2.6.5	Multi-Branch Networks (GoogLeNet)	26
2.6.6	Residual Networks (ResNet)	27
2.6.7	Densely Connected Networks (DenseNet)	28
2.6.8	Summary of Image Classification	30
2.7	Smart Bin	32
2.7.1	Smart Trash Using IoT Sensing & Mobile Application	32
2.7.2	Smart Waste Segregation	32
2.7.3	Smart Dustbin Using LoRa and TensorFlow Network	33
2.7.4	A cloud based smart recycling bin for waste classification	34
2.7.5	Summary of Smart Bin	35
2.8	Conclusion	37

CHAPTER THREE: METHODOLOGY

3.1	Introduction	38
3.2	Research Framework	38
3.3	Software and Hardware Requirement	39
3.4	Timeline	40
3.5	Conclusion	41

CHAPTER FOUR: SYSTEM DESIGN AND DEVELOPMENT

4.1	Introduction	42
4.2	Data Collection	42
4.3	ResNet Algorithm	44
4.3.1	Convolution	46
4.3.2	Batch Normalization	47
4.3.3	Max Pooling	48
4.3.4	Fully connected	49
