## ABSTRACT

Four bay nine-storey tunnel form building with reinforced concrete rigid shear walls had been designed using STAAD PRO V8i program in accordance to British Code (BS8110) and modelled using Ruaumoko 2D under seven past earthquake excitations. These ground motions are the 1986 Mexico City Earthquake, the Norway Earthquake, the 1940 EL-Centro North South Earthquake, the Grace Earthquake, the 1971 Pacoima Dam Earthquake, the 1940EL-Centro East West Earthquake and the 2007 Bukit Tinggi Earthquake. The four bay nine-storey tunnel form building had been modelled and run under seven past ground motions records based on time history-analysis by considering the nonlinear behaviour of the construction materials. This prototype had been successfully modelled under low, moderate, major, strong and great earthquake excitations using the Ruaumoko 2D program. The seismic behaviour of tunnel form building was analysed and evaluated in terms of mode shape, frequency, spectral displacement, earthquake excitations, pseudo spectral acceleration, maximum displacement for positive and negative envelopes under these ground motions based on the nodes 9, 20, 30, 39 and 50. All these nodes are located at top of the tunnel form building where the maximum lateral displacements occurred. The moment capacity of the floor slabs namely element 46, 55, 64 and 73 which obtained from STAAD PRO V8i program was compared with moment capacity demand from the Ruaumoko 2D. From the analysis results, the reinforced concrete four bay nine-storey tunnel form building is safe and able to resist the 2007 Bukit Tinggi Earthquake. However, the RC tunnel form building is not safe, fully damage and full collapse under the 1986 Mexico City Earthquake, the Norway Earthquake, the 1940 EL-Centro North South Earthquake, the Grace Earthquake, the 1940EL-Centro East West and the 1971 Pacoima Dam Earthquake. Therefore, the modelling of RC tunnel form building using Rauamoko 2D program need to be carried out to evaluate the level of safety. Seismic performance and seismic vulnerability of this type of building under low, medium and high level of earthquake excitations. It can be concluded that RC tunnel form building which designed using BS8110 (non-seismic code of practice) will suffer severe damage and collapse of buildings under medium, strong, major and great earthquakes

## **ACKNOWLEDGEMENT**

Firstly, I wish to thank God for giving me the opportunity to embark on my master and for completing this long and challenging journey successfully. My gratitude and thanks go to my supervisor Assoc Prof Dr Nor Hayati Abdul Hamid.

Special thanks to my colleagues and friends for helping me with this project.

Finally, this thesis is dedicated to the loving memory of my very dear father and mother for the vision and determination to educate me. This piece of victory is dedicated to both of you. Alhamdulillah to Allah.

<b>LIST OF TABLES</b>	<b>viii</b>
<b>LIST OF FIGURES</b>	<b>x</b>
<b>LIST OF PLATES</b>	<b>xiv</b>
<b>LIST OF SYMBOLS</b>	<b>xv</b>
<b>CHAPTER ONE: INTRODUCTION</b>	<b>1</b>
1.1 Background of the Study	1
1.2 Earthquakes in Afghanistan	2
1.3 Structural Damage during Earthquake	7
1.4 Problem Statement	13
1.5 Objectives of the Study	15
1.6 Limitation/Scope of the Study	15
1.7 Significance of the Study	16
1.8 Conclusive Remarks	17
<b>CHAPTER TWO: LITERATURE REVIEW</b>	<b>18</b>
2.1 Introduction	18
2.2 Earthquakes around the World	20
2.3 Earthquakes in Afghanistan	25
2.4 Damage of Tunnel Form Building	27
2.5 Findings from Previous Researchers	31
2.6 Conclusive Remarks	36

<b>CHAPTER THREE: RESEARCH METHODOLOGY</b>	<b>38</b>
3.1 Introduction	38
3.2 Design Four Bay Nine-Storey Tunnel Form Building	40
3.2.1 Design Procedure Using STAAD PRO V8i Software	42
3.3 Ruaumoko 2D Program	60
3.3.1 Equation of Motion for Multi-Degree of Freedom	61
3.3.2 Modelling Tunnel Form Building Using Ruaumoko 2D Program	67
3.4 Modelling Hysteresis Loops Using Elasto-Plastic Model	72
3.5 Plotting the Graphs Using Dynaplot Program	76
3.6 Conclusive Remarks	79
<b>CHAPTER FOUR: RESULTS AND DISCUSSIONS</b>	<b>81</b>
4.1 Introduction	81
4.2 Dynamic Properties of Tunnel Form Building	82
4.2.1 Mode Shape	82
4.3 Time Period, Frequency and Damped Frequency	95
4.4 Selection of Past Ground Motions	97
4.5 Nodes for Prototype Model Using Ruaumoko 2D	112
4.6 Positive and Negative Envelopes of Lateral Displacement	114
4.7 Comparison of Slab's Moments under Static and Dynamic Using Staad Pro and Ruaumoko 2D	119
4.8 Discussion	124
4.9 Conclusive Remarks	126
<b>CHAPTER FIVE: CONCLUSION AND RECOMMENDATIONS</b>	<b>128</b>
5.1 Conclusion	128
5.2 Recommendations	130
