

**PREPARATION OF NICKEL PHOSPHATE ON SILVER
PHOSPHATE VIA IMPREGNATION METHOD FOR
PHOTOREDUCTION OF HEXAVALENT CHROMIUM**

NOOR FAZLEEN BINTI MOHAMAD FAUZI

**Final Year Project Proposal Submitted in
Partial Fulfilment of the Requirements for the
Degree of Bachelor of Science (Hons.) Applied Chemistry
in the Faculty of Applied Sciences
Universiti Teknologi MARA**

AUGUST 2023

This Final Year Project entitled “**Preparation of Nickel Phosphate on Silver Phosphate via Impregnation Method for Photoreduction of Hexavalent Chromium**” was submitted by Noor Fazleen binti Mohamad Fauzi in partial fulfilment of the requirements for the Degree of Bachelor of Science (Hons.) Applied Chemistry in the Faculty of Applied Sciences, and was approved by

Dr. Mohammad Saifulddin Bin Mohd Azami
Supervisor
B. Sc. (Hons.) Applied Chemistry
Faculty of Applied Sciences
Universiti Teknologi MARA
02600 Arau
Perlis

Dr Siti Nurlia binti Ali
Project Coordinator
B. Sc. (Hons.)
Applied Chemistry
Faculty of Applied Science
Universiti Teknologi MARA

ABSTRACT

PREPARATION OF NICKEL PHOSPHATE ON SILVER PHOSPHATE VIA IMPREGNATION FOR PHOTOREDUCTION OF HEXAVALENT CHROMIUM

Hexavalent chromium Cr(VI) is toxic waste that lead to water pollution and give a negative impact on health and environment. The photocatalytic reduction is effective method to reduce Cr(VI) to harmless toxic. Nickel Phosphate ($\text{Ni}_3(\text{PO}_4)_2$) as semiconductor photocatalysts shows a great potential for reduction of Cr(VI) such as visible light driven and excellent stability of physicochemical. However, $\text{Ni}_3(\text{PO}_4)_2$ can still have recombination photogenerated electron-hole due to the single photocatalyst and narrow bandgap. Consequently, $\text{Ni}_3(\text{PO}_4)_2$ will be modified with Silver Phosphate (Ag_3PO_4) to inhibit the recombination photogenerated electron-hole pair and enhance the performance of photoreduction of Cr(VI). In this study, the effect of $\text{Ni}_3(\text{PO}_4)_2$ loaded on Ag_3PO_4 were synthesized by using impregnation method. The physical and chemical properties of $\text{Ni}_3(\text{PO}_4)_2$ loaded on Ag_3PO_4 were analyzed using FTIR, FESEM and UV-vis/DRS techniques. The performance on photoreduction of Cr(VI) were determine as followed: 5 NP/AP (98%) > 1 NP/AP (96%) > 10 NP/AP (81%) > 15 NP/AP (78%) > Ag_3PO_4 (78%) > $\text{Ni}_3(\text{PO}_4)_2$ (74%). 5 NP/AP was highest performance compared to other photocatalysts due to well dispersed of $\text{Ni}_3(\text{PO}_4)_2$ on Ag_3PO_4 as well as lowest bandgap which enhance the photoreduction of Cr(VI). Then, NP/AP was carried out for other parameters such as catalyst dosage, concentration of Cr(VI) and the effect of scavenger. The result shows the highest performance at concentration of Cr(VI) at 10 mg/L, catalyst dosage at 0.375 g L⁻¹ and the main species in this reaction was electron based on the scavenger study. Overall, the $\text{Ni}_3(\text{PO}_4)_2$ on Ag_3PO_4 successfully contribute on photoreduction of Cr(VI) under visible light.
