ACKNOWLEDGEMENTS

In the name of Allah, the Most Gracious and the Most Merciful.

First of all, we are grateful to Allah S.W.T for establishing us to complete this assignment. Without His blessing, we would not have gone this far. We are grateful to Allah who gives us sound mind and sound health to accomplish this assignment.

We would like to express our deepest appreciation to all those who provided us the possibility to complete this assignment. A special gratitude we give to our supervisor, Dr. Siti Salwana binti Mamat, whose contribution in stimulating suggestions and encouragement also helped us complete this assignment especially during the writing process.

In addition, we would like to convey our utmost appreciation to our family and friends for their cooperation, encouragement, constructive suggestion and support over the course of the project. Thank you for contributing to our work.

ABSTRACT

Pairwise comparison is commonly used in decision-making, especially in dealing with Multiple Criteria Decision Making (MCDM) problems. This study focuses on exploring effective techniques for decision-making. The Analytic Hierarchy Process (AHP) is effective but may face transparency issues, and the Potential Method (PM) is limited in handling fuzzy boundaries due to its binary nature. On the other hand, FWACS, which includes elements of graph theory and fuzziness, is introduced. The study has two main goals: 1) Apply the Fuzzy Weak Autocatalytic Set (FWACS) technique to a machine selection problem, sourced from Farhan et al. (2016). 2) Compare the results of FWACS with those from AHP and PM. The study begins with the application of the FWACS technique, followed by the representation of a fuzzy graph through a comparative evaluation of a set of alternatives. Then, a comprehensive comparison of outcomes is conducted among FWACS, AHP, and PM. The results from FWACS demonstrate stability and consistency, aligning with the outcomes from both AHP and PM. In conclusion, FWACS is emphasized for its effectiveness in tackling machine selection problems and can further be applied to decision-making involving multiple criteria.
