ABSTRACT

In Malaysia, traffic accidents are a significant public health issue, and the government is continuously seeking for measures to prevent them. Creating precise forecasting algorithms that can anticipate future traffic accidents is one method to do this. In this study, multiple linear regression and exponential smoothing as two forecasting models examined. A straightforward forecasting methodology called exponential smoothing uses historical data to forecast future values. The concept is predicated on the idea that recent data points are more significant than historical data points. Multiple independent variables are used in a more intricate forecasting model called multiple linear regression to predict a dependent variable.

ACKNOWLEDGEMENT

Alhamdulillah. Firstly, I would like to express my sincere gratitude to Allah SWT for His blessings and guidance, which have enabled me to complete this report successfully.

Moreover, I would like to express my sincere gratitude to my supervisor, Madam Rohayati binti Mat Ripin, for her invaluable guidance and advice throughout the preparation of this report. Madam Rohayati's expertise and knowledge in mathematics were invaluable to me, and her willingness to help me whenever I needed it was greatly appreciated. I also would like to extend my gratitude and thanks to Dr. Nur Atikah Binti Salahudin, the Coordinator of Final Year Report, for her guidance in finishing this report.

Furthermore, my dear parents, for their sacrifices and moral support that have helped me to succeed. My parents have always been there for me, both financially and emotionally. They have sacrificed a lot so that I could have a good education, and their support has been instrumental in my success. Last but not least, I would also like to take this opportunity to apologize to anyone whom I may have offended during the preparation of this report. I am still learning, and I am always striving to improve my writing skills. If I have made any mistakes, I hope that you will forgive me.
