ABSTRACT

Solving integration problems is very important as it is commonly appeared in wide range of fields and profession such as physics, mathematics, and engineering. There are four known theoretical methods used to solve integration problems which are integration by substitution, integration by trigonometric substitution, integration by partial fraction and integration by part. However, these theoretical methods are quite complicated and leads to long and laborious calculation. Therefore, researchers tend to use Feynman's method which is quite simple and easy. In this project, seven theoretical methods which is integration by parts, integration by substitution, Gaussian integral, Power series, Properties of integral, Trigonometric substitution and Feynman's method are chosen to solve complicated integration problems. The best method that has been choose is analysed using step and sub-step taken for both methods. The main purpose of this study is to determine the best methods for solving integration problems.

ACKNOWLEDGEMENT

In the name of Allah SWT, the Most Beneficent and the Most Merciful. Alhamdulillah, all praises to Allah for giving the opportunity and simplifying this path to complete this technical report. First and foremost, I would like to express my gratitude to the great supervisor, Dr. Mohd Rivaie bin Mohd Ali for his patience, guidance, management and valuable advice that made this report possible and completed. His invaluable help of constructive comments, suggestions throughout the research and buying me burgers have contributed a lot to the success of this report.

Deepest appreciation goes to my parents and siblings in giving me mentally supports, needed finance, and encouraged me through all this year. Finally, thanks to my undergraduate friends for their pleasant and friendly working atmosphere that I will never forget. Thanks for the friendship and memories. This technical report would not have been possible without the support of many people.
