ABSTRACT

Introduction: The bidirectional association between type 1 diabetes mellitus (T1DM) and inflammatory periodontal disease has been established, however the coordinated care between medical and dental are yet to be established. This thesis focuses on evaluating the GQ validity and accuracy as a tool to initiate coordinated medical dental care on periodontal disease in T1DM children and adolescent. **Objectives:** This study aimed to compare the accuracy of the GQ on self-screening of periodontal vs periodontal examination as initial tool among T1DM patients at the Paediatric Endocrine Clinic, to explore the perceived level of knowledge and perception of T1DM patients and/or parents on PDs and its associating factor(s) and to measure the prevalence of PDs in T1DM children and adolescents and its associating factor(s) at two clinical centres from the periodontal examination. **Methodology:** This cross-sectional study was carried out at Universiti Teknologi MARA and Universiti Malaya. T1DM patients under 18 years old were invited. Structured interviews were carried out to evaluate the participants' self-perceived periodontal health status. Periodontal health parameters, including plaque index (PI), gingival index (GI), probing pocket depth (PPD), basic periodontal examination (BPE), and clinical attachment loss (CAL) were recorded during the clinical examination. Statistical analysis was performed to evaluate the sensitivity of the questionnaire and the relationship between T1DM and periodontal parameters. **Result:** A total of 113 T1DM patients participated in this study but only 109 completed both the interview and clinical examination. The acceptable accuracy of GQ is 68.8. 55 (48.7%) have healthy gingiva, and 54 (47.8%) have gingivitis. PD was found to be statistically significant: 1) in the group age of 13-18 T1DM patients (p-value = 0.048), 2) associated with the duration of T1DM (p-value = 0.018), bleeding symptoms (p value < 0.001). Poor knowledge was observed in parents and/or T1DM patients (p-value=0.007). Despite having a good perception of their periodontal health status, clinical parameters examined revealed otherwise. There is a statistically significant association between periodontal disease and uncontrolled HbA1c (p-value=0.0018). **Conclusion:** GQ can be used as a self-screening tool, as an initiation of medical dental coordinated pathway and could be used to instil awareness on how to improve the impact of their understanding of disease control.

Keywords: type 1 diabetes mellitus, periodontal disease, children, adolescent

ACKNOWLEDGEMENT

First and foremost, I want to express my gratitude to God for providing me the chance to pursue a doctorate study in Paediatric dentistry and for allowing me to complete this lengthy and challenging journey successfully. I am grateful to all the wonderful children and their families because without them, this project would only exist as an idea. I am inspired by their huge desire to assist the kids who might benefit from this study's findings.

I am extremely grateful to my supervisors, Assoc Prof Dr Rohaida Abdul Halim, Dr Erni Noor, Associate Professor Dr Noor Shafina, Associate Professor Dr Azriyanti, Dr Nor Shafina, Dr Nurul Zeety Azizi for their immeasurable support and guidance over the past three years in terms of time, effort, wisdom, and knowledge in order to make this thesis possible. This thesis is the result of their unwavering support, assistance, and suggestions that went beyond the scope of a research project. My deepest gratitude to Mr Shahrul Aiman, from Clinical Research Centre, Hospital Sultanah Bahiyah, for his expertise in this project. I am appreciative of the financial assistance from the Universiti Teknologi MARA Sungai Buloh (UiTM) for funding the current project as well as Ministry of Health Malaysia for funding my study.

I would also like to thank my wonderful team of support staff which includes Mrs Hazean and Mrs Suzilah from Paediatric Clinic, UiTM, Mrs Noor Azleen from Paediatric Clinic, UM for finding all the requested hospital records, Marshah, Aisyah and Sarah, my research assistants, for their help with data collection and all the staff in the Department of Paediatric Dentistry, for their help and support. Thank you to my wonderful friends Dayang, Zalikha, Zul and Saima who have supported me, listened to my vents, given me advice, put up with me and kept me in check.

Finally, this thesis is dedicated to my beloved mother, _____ and my beloved father Mr Zainal Abidin Kharsani, who never stop in giving words of inspiration and encouragement. Their unconditional love and support have motivated me to keep going and doing the best in everything I do. My husband, a partner, soul mate, and best friend, Saifuruddin, who is always all ears when I complained, gave me his shoulder to cry on and comforted me when I was down, shared laugh with me and most importantly, never judged me. I am particularly grateful for your patience of our long-distance relationship and caring for our household, especially in the last three years. Additionally, Aqil and Sofia, my two little angels for whom I live and keep me alive with their hugs, kisses and laughs. Simply put, this thesis is not mine alone. It belongs to my family as they have also invested as much effort and time to help me complete it over the course of three years. Thanks and utmost gratitude to mother and father-in-law as well, Mrs Noorlizan Said and Mr Mohd Razie Jaafar for their support during these three years and for the care and love they have poured out for me and my children. Last but not least, my sisters Fatin, Hawa, Syimah, Anisah and my brothers Ridwan, Hasan, Husin, Hashim- a big thank for being my cheer and for more reasons than I can list.

This piece of victory is dedicated to each one of you. Alhamdulillah

CHAPTER ONE

INTRODUCTION

1.1 BACKGROUND

Type 1 Diabetes Mellitus (T1DM) is a class of diabetes mellitus (DM) disorder that is commonly diagnosed in children and adolescents (Atkinson, Eisenbarth, & Michels, 2014; Dana Dabelea, 2009). It is considered the third most prevalent childhood chronic disease in the United States after obesity and asthma (Stanescu, Lord, & Lipman, 2012). The highest pooled incidence was registered in the European region at 15.5 per 100,000 children per year (15.5/100,000/year) (95% CI = 13.5–17.5), followed by the American region with an incidence of 11.4/100,000/year (Adeloye *et al.*, 2018). Interestingly, the lowest T1DM incidence was reported in China (0.1/100,000/year) despite having the largest population in the world, which is in contrast to the reported T1DM incidence in Finland among children aged 0 to 14 years old at 57.6/100,000/year (Soltesz, Patterson, & Dahlquist, 2007).

These statistics mark a 350-fold difference compared to the reported incidence in the early 1990s. The significant impact could be due to hereditary and genetically susceptible individuals as a result of environmental factors, as indicated in the aetiology of T1DM, as well as the rapid social change in many countries that influenced the population exposure to putative etiological factors for T1DM (Maahs, West, Lawrence, & Mayer-Davis, 2010; Tom, Ken, & Matthias, 2011). Table 1.1 presents the prevalence of T1DM in several countries.
