September 2016

ABSTRACT

Monitoring of extracellular brain glutamate (Glu) level by microbiosensor is a promising approach for further investigation of the important role of neurotransmitter. The neurotransmitter glutamate has shown in development of brain function including cognition, memory and learning process. Glutamate microbiosensor should serve high sensitivity which able to response for low concentration, high selectivity from interferences, fast and accurate result. Surface teflon encapsulated platinum (Pt) electrode disk design of internal size diameter 50 μm , electropolymerized with poly-*o*-phenylenediamine (PPD), layered with nafion (Naf), immobilized with glutamate oxidase (GluOx) and cross-linked glutaraldehyde (GA) (Pt₅₀/PPD/Naf/GluOx/GA) has chosen in glutamate detection and performed promising glutamate biosensor using constant potential amperometry (CPA) where Michaelis-Menten for glutamate response, $J_{max} = 120 \mu\text{Acm}^{-2}$, $K_M = 60 \mu\text{M}$ and limit of detection (LOD) is $2.5 \mu\text{M} \pm 0.5 \mu\text{M}$ were obtained. The response time was $\sim 9\text{s}$ which is three times faster as compared to Pt₅₀/PPD/GluOx/Ga. The developed glutamate microbiosensor have established an excellent in rejection against ascorbic acid (AA) and other interferences. This electrode designed configuration shows good sensitivity in neutral pH range at pH 7.5. The stability of the electrode was stable until 3 days and kept in cold temperature at 4°C. The reduced enzyme activity on the electrode was due to dissolution of the enzymatic membrane during storage and causing the sensitivity of electrode less stable along the period. In vivo studied shows that data sampling rate of electrode without enzyme (Pt₅₀/PPD/Naf) and with enzyme (Pt₅₀/PPD/Naf/GluOx/GA) were 0.0022 μA and 0.0039 μA , respectively. The ability of glutamate microbiosensor in monitoring the presence of glutamate in the prefrontal cortex of anaesthetized rats was proven.

ACKNOWLEDGEMENT

First, I would like to thank my academic supervisor Dr. Zainiharyati Binti Mohd Zain for her support throughout the last 3 years. She has been a great mentor who gave me the opportunity to gain a lot of experience in the field of academic research and science.

I would like to thank my mother and my father, Binti Basri and Hamdan Bin Samsi for support in terms of spirit to continue my study and financial and not forget my sister, Ohara and my brother, Hakim who were very helpful and supportive.

Furthermore, I would like to thank my lab groups, lab assistant, Puan Siti Hamidah binti Mat Soad and lecturer of Electrochemistry, Dr. Yusaire Bin Mohd who help me a lot in order to arrange the instrument and provide the authorization in facilities of in Corrosion Lab, B208, Faculty of Applied Sciences, UiTM and completed my master.

The experiments of *in vivo* application were performed in the laboratory of Centre of Drug Research at Universiti Sains Malaysia (USM), Penang, Malaysia. I would like thank to my lab partner, Nor Fasiah Binti Azam and her supervisor, Dr. Zurina Binti Hassan for helping me in pursuing my goals in the experimet, rat surgery, electronic facilities and data analysis. I would like to thank them for this wonderful collaboration.

I would like to thank Ministry of Education for give the financial opportunity, My Brain 15 for my study to support my study fees.

CHAPTER ONE

INTRODUCTION

1.1 BACKGROUND

1.1.1 Glutamate

Glutamate was known as neurotransmitter and it required a long investment to acknowledge it. The researcher group figure it in spite of the fact that it was noted as of now 70 years back and in light of glutamate is rich in cerebrum and assumes a critical part in mind digestion system. Unexpectedly, the explanation behind the deferral appears to have been its staggering significance. Glutamate is one of the common 20 amino acids which are utilized to make proteins and takes parts in run of the mill metabolic capacities like vitality creation and smelling salts detoxification notwithstanding protein blend. It was difficult to trust that a compound with such a variety of capacities and which is available practically all over in high focuses could assume an extra part as transmitter.

Glutamate (Glu) molecular structure as shown in Figure 1.1 is not only important neurotransmitter in the brain of mammals but also plays a main role in development of brain, neurotransmission, synaptic plasticity, neurotoxicity but also involves in some brain or neurological disorder such as ischemia (Camacho & Massieu, 2006; Baltan, 2009), schizophrenia (Breese et al, 1995; Boison et al, 2012), epilepsy (Babb et al, 1998), Alzheimer's disease (AD) (Walton & Dodd, 2007; Gong et al, 2009; Fayed et al, 2011), Parkinson's disease (PD) (Gubellini et al., 2004). Moreover, brain injury also can cause elevation of glutamate level (Richards et al, 2003; Luo et al, 2011). Hence, it is very important to observe the levels of extracellular glutamate concentration in the affected brain due to the importance in neurotransmission. Recent discoveries have revealed that glutamatergic neurotransmission in the central nervous system (CNS) is mediated by a dynamic interaction between neurons and astrocytes because in order to control the concentration of glutamate from become excitotoxicity, a complex system required to regulate glutamate metabolism (Niciu et al, 2012).
